**Subject: Request for Letters of Interest  
GRU No. 2006-169**

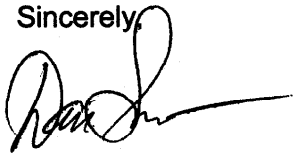

Dear Mr. Wisco:

Siemens Power Generation, Inc. has reviewed the above request for letters of interest for your Deerhaven Power Plant site. Our Fuel Gasification group has tested a wide range of biomass feedstock in our gasifier over the last ten years so we believe the plant concept you are considering is technically feasible. However, at this time, we are still in the process of integrating the Siemens SFG gasification technology business that we recently acquired into our power generation business and we are not currently in a position to respond to your request directly. Our near term focus for IGCC applications is on developing larger coal based IGCC plants in the 600 MWe net size range.

We have a wide range of technologies that could be applied to this type of plant from gas turbine generators (for example, our SGT6-5000F gas turbine on syngas is rated at 232 MW), steam turbine generators, instrumentation and control systems, and compression solutions. More information about the technologies and services we can provide is located on our web site at [www.siemens.com/powergeneration](http://www.siemens.com/powergeneration).

We want to thank you for your interest in Siemens IGCC products and we would be pleased to visit with you to review our IGCC and gasification capabilities and experience.

Sincerely,

Dan Smith
